

# Machine Learning Engineering Nanodegree

## Capstone Proposal

### Domain Background

According to the CDC motor vehicle safety division, one in five car accidents is caused by a distracted driver. Sadly, this translates to 425,000 people injured and 3,000 people killed by distracted driving every year. In 2015, 391,000 people were injured and 3477 were killed in motor vehicle crashes involving a distracted driver (Source: <https://crashstats.nhtsa.dot.gov>).

	2010	2011	2012	2013	2014	2015
Distracted Driving Deaths	3,092	3,331	3,328	3,154	3,179	3,477
All Motor Vehicle Deaths	32,999	32,479	33,782	32,894	32,744	35,092
Distracted Driving Injuries	416,000	387,000	421,000	424,000	431,000	391,000
All Motor Vehicle Injuries	2,239,000	2,217,000	2,362,000	2,313,000	2,338,000	2,443,000

State Farm hopes to improve these alarming statistics, and better insure their customers, by testing whether dashboard cameras can automatically detect drivers engaging in distracted behaviors. State Farm released a public dataset for a Kaggle Competition to detect and classify distracted driver. For the Capstone Project, this dataset will be used.

### Problem Statement

From a set of 2D images captured from dashboard camera (source: Kaggle), the aim of this project is to classify and predict driver behavior if they are driving attentively or engaged in distracted behavior.

### Datasets and Inputs

The dataset used here in this Capstone Project is obtained from State Farm Distracted Driver Detection competition (<https://www.kaggle.com/c/state-farm-distracted-driver-detection>). The images were taken using a camera mounted in vehicle's dashboard. To avoid accident, this data was captured in controlled environment where instead of driving the vehicle, a truck was used to drag the vehicle around the street. Each image classified as:

c0: Safe Driving

- c1: Texting - right
- c2: talking on the phone – right
- c3: texting – left
- c4: talking on the phone – left
- c5: operating the radio
- c6: drinking
- c7: reaching behind
- c8: hair and makeup
- c9: talking to passenger

Here are some example images of normal driving (c0) and distracted driving (c1 to c9) such as texting, talking to phone, doing makeup, talking to passenger etc.

The dataset consists of 22400 training and 79727 testing images. All images are 640 x 480 pixel size.

### **Solution statement**

To solve the problem stated in this project, a convolutional neural network will be developed using Tensorflow/Keras to classify each network as CNN provides high accuracy in classifying images. Network will be trained using training data. CNN will be implemented to minimize multi class logarithmic loss. Prediction will be made on test data set and compared with benchmark model.

### **Benchmark Model**

The model with the public leaderboard score will be used as a benchmark model (<https://www.kaggle.com/c/state-farm-distracted-driver-detection/leaderboard>). The aim is to be in top 50% of the public leaderboard submission.

### **Evaluation Metrics**

Solution and benchmark models will be evaluated using the multi-class logarithmic loss. Each image has been labeled with one true class. For each image, a set of predicted probabilities is computed. The formula here is:

$$\text{logloss} = -\frac{1}{N} \sum_{i=1}^N \sum_{j=1}^M y_{ij} \log(p_{ij})$$

where  $N$  is the number of images in test set,  $M$  is the number of image class labels,  $\log$  is the natural algorithm,  $y_{ij}$  is 1 if observation belongs to class  $j$  or 0 if otherwise and  $p_{ij}$  is the predicted probability that observation  $i$  belongs to class  $j$ .

### **Project Design**

The project is aimed to classify the distracted driving behavior. To do so, first step will be reading the train and test data. Then a Convolutional Neural Network will be created in Keras and trained with training data set. Then, it will be tested using subset of test data. Final step will be predicting the test data and performance evaluation.
